

Power of Number.

Problem Statement

Write a program to calculate the power of a number using the built-in `pow()` function. The program should take two inputs:

- Base (a) – the number to be raised.
- Exponent (b) – the power to which the base is raised.

Input Format

- Two integers (base and exponent) separated by a space.

Output Format

- A single number representing the result of a^b .

Sample Input 0

```
2 3
```

Sample Output 0

```
8
```
